Getty Images The total solar eclipse on August 21 is the first of its kind visible in the United States in 38 years. But if you can't figure out a way to see it in full glory, don't worry: The other one is coming up and it won't be that long to wait this time. Although the last total solar eclipse visible in North America occurred in 1979, we don't have to wait long for the next one. According to Time, the next total solar eclipse will be visible in the United States on April 8, 2024 - just seven years later. In the meantime, there are many other eclipses to look forward to, some of which are happening as early as next year. On January 31, 2018, we will have the opportunity to experience a total lunar eclipse; according to KWCH, it will be available in western North America. A lunar eclipse is like a solar eclipse, in the sense that the Moon, the Sun and the Earth are exactly aligned. The difference is that during a solar eclipse, the moon intersects directly in front of the sun, blocking its light, while a lunar eclipse means that the moon passes directly behind the Earth, often causing the moon to turn reddish. Getty Images As for solar eclipses, they will also occur in 2018, but they will not be total eclipses; instead, they will all be partial eclipses. As the names suggest, a partial eclipse means that the sun and moon will not be directly aligned, only partially. In other words, it will look like something picked up by a bite from the sun. But, according to Space.com, unfortunately, none of these partial eclipses will be visible from the United States next year. Getty Images So while it may be too late to plan a trip for this year, there is still plenty of time still in 2024 to organize a vacation and witness this natural wonder. You can find more information about this and similar content in the piano.io Commons Wikimedia Tonight (US time), a 90-mile stretch in Indonesia, Borneo and Sulawesi will get a spectacular spectacle: a total solar eclipse. The Slooh Observatory will live stream the event, which culminates in a total eclipse at 7:37pm EST. Their coverage of the event will begin at 18:00 Moscow time. A solar eclipse occurs when the moon passes in front of the sun so that it will wash the light completely. This is the only such event this year, although next year there will be a total solar eclipse visible in several parts of North America. Today's event is only visible in that 90-mile stretch, so for most people, internet streaming is the only way to see it. According to The Verge, one Alaska Airlines flight to Hawaii even adjusted the flight path and departure time to capture the eclipse. Australia, China, Alaska, Hawaii, and Southeast Asia will also see significant partial eclipse, according to the New York Times. You can watch the event happen in the video below. Be prepared - it's going to be a show. Show. Content is imported from YouTube. You can find the same content in a different format, or you may be able to find more information on your website. You may be able to find more information about this and similar content on piano.io My doubts first set when my alarm went off before 8am on Sunday morning. Has the total solar eclipse cost to donate sleep more, let alone spend hundreds of dollars and a day's travel to the far corners of North Carolina for an event that will last just a couple of minutes? From the accounts I read, it seemed the answer was a resounding yes. Bill Kramer, founder of Eclipse-Chasers.com, told Esquire that watching the moment of totality was like the eye of God suddenly looking down on you and saying: What happened? Everything I read made it seem seeing a total eclipse in real life will change my life, or at least inspire a visceral and emotional reaction. So, I realized that this would be my best chance to see it. It's all worth advertising, since this solar eclipse is the first time a total solar eclipse has touched the bottom 48 since 1979, and the next one won't happen here for another seven years when the shadow of the moon will cross from Texas to Maine on April 8, 2024. But on the way to the airport early Sunday morning, I doubted it. On my two-hour flight from New York to Charlotte, North Carolina, and even more so on my two-and-a-half hour drive further to North Carolina, I doubted it. Is it worth spending my weekend traveling to something that could be ruined by cloudy weather or a little rain? Lindsay Matthews As if the eclipse wasn't completely hyped yet, once I arrived in the small town of Brevard, North Carolina's fervor became even more intense. Although most often come to Brevard (pronounced bre-VARD) to see 250 waterfalls of Pisgah National Forest or go on a mountain bike along the vast trail network, it seemed that everyone here had one goal now, and it was an eclipse. Signs hawking a \$40 eclipse parking lot were scattered across the city, while a woman checking me into my room at the Hampton Inn wore a T-shirt with a cartoon version of one of the city's famous white squirrels watching the solar eclipse on it, and a couple hundred amateur astronomy enthusiasts. While PARI was once a NASA satellite tracking station in the infancy of the U.S. space program and part of the Department of Defense during the Cold War, it is now a non-profit center open to the public where everyone can learn more about astronomy. I am I if someone could make me appreciate the importance of what I was going to see, it would be the scientists here who have been planning this event for the last 20 years. I've seen a solar eclipse once in my life. By chance, I was on vacation in Paris with my family on August 11, 1999, when a total solar eclipse passed over a large part of Europe. What I remember most about it, however, is my mom hands me glasses and tells me I could go blind if I took them off. I don't remember it getting dark outside, or the birds weren't singing, or getting a tremendously emotional reaction to it. It looked cool, but I almost don't remember what it looked like. Lindsay Matthews This time it was very different. PARI is set on two ridges, so our 360-degree view of the surrounding mountains was beautiful even without such a cosmic coincidence. When the moon began to move over the sun, the sky was clear, and the crowd gathering there began oh-ing and ah-ing. And then the clouds moved in. While it was a welcome respite from the suffocating humidity, it covered up our entire view of the eclipse. Moving to the totality we would have seconds where we could see it peering through the clouds, but when the aggregate approached the forecast was grim. Eclipse - and gorgeous people crown waxing poetic about it in the accounts I read - were completely blocked by the clouds. But it didn't matter. Because, as the totality happened, the whole sky was remembered. Not only is the twilight dark, but completely black on the outside with barely a sliver of peach-colored sunlight right on the horizon. Like almost everyone I've spoken to in North Carolina, John Sinclair, curator of meteorites and minerals at PARI, had never seen a total solar eclipse before. We didn't get the show number #1 Sinclair said, but it didn't matter to him. It was incredible. I was absolutely amazed at how dark it got. Some are lucky enough to also see the diamond ring as the eclipse comes out of the totality. You get a really bright spot with the contour of the sun as Sinclair describes it. It's like a diamond sitting on the edge of the sun. Don Kline, president of PARI, plans for 20 years to see today's eclipse. Although he knew very well that there was only a 25 per cent opportunity to get a clear picture of the moment of totality, he was not disappointed. We eventually see parts of it, and in total we were able to see Jupiter, Kline said. Others saw stars, some saw birds fly confused by sudden darkness, while others felt the temperature drop. Although the clouds blocked my view of the crown, I was too struck by my unexpected emotional reaction to the sight of the dark sky in the middle of the day to even take even these small details. Curious to see why this time was so different, I realized that where I watched the 1999 solar eclipse in Paris was just from the path of totality. While I saw the moon bite off the sun that day almost 20 years ago, I didn't feel the sudden darkness in the middle of the day that I saw in North Carolina today. The difference was literally day and night. If you weren't in the way of totality today, I have to agree with this quote from the total eclipse essay by Annie Dillard, which was reissued by The Atlantic: Partial Eclipse is very interesting. It has almost nothing to do with seeing a total eclipse, how kissing a person does to marry him or how flying in a plane does to fall out of a plane. Although one experience precedes another, it does not prepare you for this... What you see in the total eclipse is completely different from what you know. The next time a total solar eclipse passes over American soil will be April 8, 2024, and you bet I'll be somewhere in the path of totality again. In fact, I am already looking for flights to Buenos Aires for the next total solar eclipse in the world on July 2, 2019.
